

banking.py

p.meta-info Script Type: Console Application • Purpose: Basic Banking System Simulator

PROGRAM DESCRIPTION

This Python script implements a lightweight, terminal-based **Banking System Simulator**. It utilizes a stateful loop to continuously handle user interactions until an explicit exit command is issued. Supported core features include checking account balance records, simulating cash withdrawals, processing structured cash deposits, and validating third-party monetary transfers.

SOURCE CODE LISTING

```
menu = ''' -----  
Banking System 1.0  
-----  
1. Check Available Balance  
2. Withdraw Cash  
3. Deposit Cash  
4. Transfer Money  
5. Exit  
-----  
'''  
  
amount = 0.0  
while True:  
    print(menu)  
    option = int(input('Select Option from Menu: '))  
    if option == 5:  
        print("Terminating Program.....")  
        break  
    elif option == 1:  
        print("User is checking available amount")  
        print(f"Available Balance: {amount}")  
    elif option == 2:  
        withdrawamount = float(input("Enter Amount: "))  
        if withdrawamount <= amount:  
            amount -= withdrawamount  
            print(f"Successful  
Available Balance:{amount}")  
        else:  
            print(f"Insuffient funds  
Available Balance:{amount}")  
    elif option == 3:  
        cash = float(input('deposit amount: '))  
        print(f"Initial Balance was: {amount}")  
        amount += cash  
        print(f"Final Balance after depositing is: {amount}")
```

```

elif option == 4:
    name = input("Enter recipient name: ")
    transferamount = float(input("Enter Amount: "))
    if transferamount <= amount:
        print(f"Intial Balace:{amount}")
        amount -= transferamount
        print(f"Transfer of {transferamount} to {name} was successful
New balance :{amount}")

        print(f"Tranfer unsuccessful due to insufient funds
Available Balance:{amount}")
    else:
        print("Option not available")
print("Have a nice day!")

```

FUNCTIONAL SPECIFICATION OVERVIEW

Menu Option	Operation Description	Validation Rule Logic
1. Check Balance	Prints current internal balance variable.	None. Always permitted.
2. Withdraw Cash	Deducts specified currency values from standard funds.	Ensures request amount $\leq$ total current funds.
3. Deposit Cash	Increments internal floating-point global variable.	Accepts any numeric user inputs.
4. Transfer Money	Simulates routing funds to a designated recipient string.	Checks transfer capacity against available ledger funds.
5. Exit	Breaks the infinite execution loop.	Gracefully prints a closing signature.
